Q: What’s the best treatment for crow’s feet?

A: Crow’s feet, the lines at the outside corners of our eyes are formed over time as a result of squinting or losing facial volume. There are five methods of reducing or eliminating these crow’s feet: Botox, microneedling, fractional laser, RF skin tightening and ultherapy.

RF skin tightening and ultherapy heat up the collagen so the skin contracts and the lines will be diminished. Fractional laser and microneedling stimulate the skin to repair itself and build new collagen.

Lastly, Botox or Dysport can be injected into the crow’s feet to relax the facial muscles causing the lines and temporarily smooth out that area.
